I want to get something like this (where t = 5 and n = 4): (0.10, 0.11, 0.20, 0.21, 0.30, 0.31) This is what I tried so far, which is wrong (for example, 0.11*5 = 5.55 instead of the desired answer 5.5): 0.11 * t I am also aware of numpy, but I do not want to apply numpy's functionality to this case. Is there any better way to do this? A: numpy.where: >>> import numpy as np >>> 1 = np.
