User Interface Customization AutoCAD's user interface is a front end for the drawing application. The interface can be customized by changing the various color schemes and font styles. The interface can be augmented through the use of plugins. Lines, arcs, and spline geometry are the primary types of geometric entities in AutoCAD. Lines and curves The basic geometric primitives are lines and curves. Lines are parallel or non-parallel to the X-axis. Curves may be either quadratic or cubic. With the ability to zoom into the drawing window, lines can be displayed in any length. Lines can be repositioned by dragging them. Curves can be extended by dragging them. To create an arc, the shape is transformed to a circle or ellipse, then the Arc tool is used. An arc is best used for simple shapes. Curves and arcs can be edited with a variety of tools: Circle, Line Intersect, Move, Offset, Trim, Path, Change Center, Arc (inside or outside), Ellipse, and Vertex Join. Polylines Polylines (or multi-lines) are like lines, except they have no thickness. Polylines can be moved in any direction. They can be extended by extending the connected line segments. Polylines can be edited with a combination of tools: Move, Offset, Trim, Change Center, Rectangle (length, height, width), and Extend. Raster Graphics To create a raster graphic, a block of pixels is added to the design. The pixels may be colored, sized, rotated, and placed as desired. A raster graphic is not editable, once it has been created. A raster graphic may be converted to an image (rendered), saved as a bitmap, or converted to a vector graphic. Vector Graphics To create a vector graphic, the geometric entities of the drawing are converted to geometric primitives. For example, a line is converted to a vector line (or polyline), a circle is converted to a vector circle, etc. A vector graphic is editable, once it has been created. Once a vector graphic is created, it can be modified with a variety of tools: Edit Path, Scale, rotate, mirror, move, and so on. Drawing Information Objects Objects are geometric entities which 5b5f913d15

Another day, another candidate for the Oval Office seems to have fallen prey to sexism. That, despite a record number of women running for president. Politico reported Friday that former North Carolina Sen. Kay Hagan, who lost her seat to upstart Republican Greg Brannon, called a voter who supported her opponent a “bitch” and “rude.” A former staffer for Hagan’s opponent, Brannon, told Politico Hagan said the insult, which was directed to a female voter. Hagan was running for re-election in the red state of North Carolina, which is a key swing state. Hagan did not respond to the report. A Brannon spokesman told Politico the candidate would have no comment. Of the 20 women running for the GOP nomination, 19 have dropped out of the race. Former Arkansas Gov. Mike Huckabee, who has a close relationship with the evangelicals who would be a critical part of the Republican electorate, is the lone female Republican left. But that doesn’t mean there aren’t plenty of female Democratic candidates. At the moment, there are 20 women seeking the Democratic nomination for president, more than double the number of women running for the same position in the Republican Party. But despite this gender disparity, women still seem to be having trouble getting heard. The Washington Post’s Jim Tankersley wrote recently that women were having trouble distinguishing themselves in the field because the Democratic candidates were “not that different.” Read next: Why Are Women Less Likely to Be Top-Rated Salespeople?
