Photoshop supports the following file types: PSD (Photoshop Document), EPS (Encapsulated PostScript), PDF (Portable Document Format), AI (Adobe Illustrator) and EPS (Encapsulated PostScript) formats. Vector art is still the preferred and most efficient way to create art for print. Also, Illustrator is still much easier to use than Photoshop for some users. Icons Photoshop has many pre-installed icons that make navigating the application much more efficient. The most helpful icons are the following:

- Undo: Undo enables you to edit any image one layer at a time. You can undo multiple changes or a single change. If you undo a change that you make to an image, you lose that change and need to start over.
- Forward: Forward enables you to jump through the layers of an image. Without this command, you need to open each layer to access a specific change.
- History: The History icon (it has an orange icon) makes it easy to jump to previous states of the image. This makes it easy to go back and examine images before making big changes.
- Pan/Zoom: The Pan/Zoom icon makes it easy to zoom into and out of an image without manually resizing it. The information for the current zoom level is displayed on the icon.
- Redo: The Redo icon (it has a red icon) enables you to reverse the last action. If you inadvertently move an object on a layer and then accidentally undo that action, you can undo the undo action by pressing Redo. This redo icon is a bit confusing because it shares space with the forward icon that enables you to jump through the layers.

Photoshop's interface When you open Photoshop, you see a large, rectangular workspace area that is divided into a vertical workspace and a horizontal workspace. The top of the workspace contains a toolbar that lists the most common tasks that you can perform. The toolbars include the following:

- Toolbox: The Toolbox has icons of tools that you can use to create and modify images. The list of tools in the toolbox changes as you use the different tools. The tools include the following:
- Paintbrush: A paintbrush is used to create shapes in the layers, including circles, squares, rectangles, lines, and paths.
- Select: A selection tool enables you to isolate and manipulate a specific object

Intravesical BCG therapy in superficial bladder cancer. A systematic analysis. BCG (Bacillus Calmette-Guérin) is a potent antitumor agent that is effective in the treatment of superficial bladder cancer. After BCG administration, a number of responses may be seen which are designated as superficial or deep. A combined analysis of previously published clinical trials has shown that only approximately 50% of the superficial tumors are sensitive to BCG and that the remaining tumors respond to a different modality, such as endovesical electrocoagulation. The number of BCG failures is increasing with the advanced stage of the disease. This review will evaluate the causes of BCG failure and the possibility of raising the BCG therapy index. The reasons for the high failure rate in superficial tumors are considered to be the poor distribution of BCG and the nonspecificity of the antitumor effect. Clinical investigations have shown that increasing the total dose of intravesical BCG can increase the cytotoxic effect without increasing the number of BCG failures and can thus increase the BCG therapy index. However, this factor does not seem to be sufficiently important in superficial tumors. Low-dose BCG does not raise the BCG therapy index. Intravesical BCG therapy should be restricted to patients who have tumor contact with the mucosa of the bladder. Although the results of BCG treatment in superficial tumors are disappointing, it is possible to raise the BCG therapy index, to prolong the time to relapse, and to reduce the number of recurrences by increasing the total dose of BCG in superficially staged tumors. The general aim of the research is to develop and validate human models that will permit a better understanding of the basic mechanisms involved in glaucoma and eventually permit better design of antiglaucoma therapies. The specific aim is to develop a novel human model for the study of glaucoma, which combines high-resolution video-documentation and spectral-domain optical coherence tomography to study ocular pressure fluctuations. A human in-vivo model will be developed in which ocular pressure, pressure fluctuations, and ocular surface structure (including corneal shape) are recorded simultaneously in the same eyes. Preliminary data from the research group already show the potential to accomplish this goal. During the first part of this project, the basic measurements needed to develop such a model will be performed in selected patients. The second part will be the development of the model itself.
