All solutions require special adapter kits to convert the DVD and the corresponding storage media (BLV cartridges) into an format that the electronic platform of the television or another playback device can accept. There are two well-established standards for encoding the DVD video and other DVD content onto computer-readable media: the Blue-ray Disc (BD) and the Blu-ray Disc (BD-R) formats. Neither of these two formats is suited for direct recording of television programs on a computer hard disk drive (HDD) or solid-state drive (SSD) (although the BD format has been designed for this application). The DVD is a storage medium that has an information capacity of about four to five times that of the VHS video tape (0.6 to 0.7 gigabytes per hour compared to 0.1 gigabytes per hour). The medium can hold as many as 8.5 million times as many digital pictures (as uncompressed data) as it can hold analog pictures (as compressed data). The main drawback of the DVD as compared to other storage media, such as a hard disk drive (HDD), is that it requires much more power to read and write the data than a hard disk drive. The VHS tape, while offering better picture quality than a DVD, is not a long-term storage medium and has a much lower information capacity. In 2008, approximately 26 years after it was introduced, the VHS tape reached the end of its lifespan, and many retailers and manufacturers have since ceased production of this type of tape. The tape is not readable by computers or other devices, and in 2009, the format of the VHS video tape was officially changed to analog standard definition (SD) at 768x576 pixels resolution, about the same size as the earliest 4:3 aspect VHS tapes.
